

Character Profile: Aslan

Role: The Martyr / Scientific Sidekick

Physical Identity

Age: 17/18 (Dies in his prime, likely before reaching 25)

Height: 182 cm (roughly 6'0"), giving him a looming but fragile presence

Nationality/Heritage Chinese, Turkish, Afghan, Saudi lol

Complexion: Mid-brown (Wheatish/حنطي). Not quite pale, not quite dark

Appearance:

Face: Sharp, aristocratic nose and a thin expressive mouth, wears glasses (duhh), عنده لحية و شوراب و شكله اكبر من عمره

Eyes: Deadly shallow grey eyes that look like cold ash, reflecting his exhaustion

Hair: Messy, curly brunette hair that hangs over his face

Build: Gaunt and weary, he has "loose muscles" the body of someone who was built for strength but has been withered by constant internal pain عنده عضلات بس يعني مو شسمه مو كثير

Attire & "The Barrier"

The Guard: never seen without heavy, restrictive clothing

Style: dark, high-collared turtlenecks or long-sleeved tunics that button tightly at the wrists

Gloves: He wears leather or thick fabric gloves 24/7 for safety seal to protect the world from himself

Persona (disturbing the peaceeeeeeeee) : The Observant Scientist

Mind: quiet and highly analytical. While others in the dark fantasy world rely on magic or idk whatever they rely on, he relies on identifying genes and biological patterns (bleguh) He spends his nights doing research on himself and the remains of his family, trying to solve the "puzzle" of his own blood. A bit selfish, self-centered who completely

cares about himself, though he would be complete the opposite if he had a friend or a loved one

Genetic Curse: " Recessive Singularity"

He discovered through his research that his power isn't a **"magical spell"** but a latent genetic mutation

Mechanism: This gene creates a field of "Empathetic Agony" Anyone who touches his skin experiences his lifetime of suffering instantly (يعيش اللي عاشه the unknown and he dies worse)

Inheritance: This specific gene can only be "activated" if both parents carry a specific sequence but it remained dormant in them. He is the first in generations to have the gene "wake up" ... **The Only Exception**, since the field only recognizes DNA identical or nearly identical to his own, his last hope is his sis, he had a twin sister (lost, presumed dead) Since they shared the same womb and genes, she is the only person in the entire world who could have held his hand without dying, but since he believes she is dead, he views himself as a "biological dead end"

Backstory: A Lifetime of Solitude

Childhood: Raised in total isolation after the death of his kin, grew up seeing people as "danger zones" has never experienced a hug a handshake or the brush of a hand against his face from anyone beside his family

Motivation: He follows the protagonist (idk if it's a he or a she) cuz they are the only person who treats him as a comrade rather than a curse, He is willing to endure everyone's pain just to feel like he belongs to a "pack" even if he can never truly be part of it

Active Ability: The Black Hole (Siphon of Agony)

Power: Can pull the pain and physical damage from his allies into his own body, and suffer from the pain constantly so whenever he must use this ability it has to be someone who's considered special to him, he views this as "borrowing cellular trauma" cuz he knows exactly how much his body can take before his organs fail, yet he continues to do it for the protagonist because it's the only way he feels "useful" to humanity

Death:

Option 1 The "Self-Dissection"

He realizes that the only way to save the protagonist from a specific parasite or "genetic curse" is a serum that can only be made from the heart-blood of someone with his specific, untouchable gene

The Sacrifice: He doesn't just "die" in battle but he has to scientifically oversee his own death. He must walk the protagonist through how to harvest his blood or organs while he is still conscious, because he is the only one with the medical knowledge to do it right. He dies on a cold stone table, narrating his own organ failure to the person he loves/loyal to, and the last thing he feels isn't a touch, but the cold metal of a scalpel and he dies as a "specimen" rather than a man

Option 2 The Infinite Siphon

The party is trapped in a "Death Zone" or a collapsing magical fortress, a cursed desert, or a battlefield where an endless wave of dark energy is being emitted. To keep the protagonist and the others alive, he must keep his "Black Hole" (The Siphon) open permanently for hours, or even days, without a second of rest

(The Suffering):

Stage 1: Sensory Overload. As he absorbs the exhaustion of others, he stops being able to sleep, even if he closes his eyes, his brain is "firing" with the borrowed adrenaline and terror of his friends. He becomes a twitching, wide-eyed ghost

Stage 2: Muscle Liquefaction. Because he is 180+ and "thin with loose muscles" his body has no reserves and to keep the power going, the "Black Hole" starts consuming his own tissue like his brunette hair turns brittle and begins to fall out in the wind and his sharp nose becomes even more skeletal as the fat disappears from his face

Stage 3: The Grey Death. His grey eyes begin to leak a thick, ashen fluid, it's his nervous system literally melting from the sheer volume of "pain data" passing through it and since he's a "wannabe scientist" he knows exactly what is happening and he is narrating his own death to the protagonist not for drama, but as a biological record

As he reaches his limit, he loses the ability to speak. His "thin mouth" hangs open, but no sound comes out because he has absorbed so much "throat-pain" from his allies that his vocal cords have snapped and he doesn't die in a flash of light, he simply stops, he becomes so exhausted that his brain "forgets" how to tell his heart to beat, he falls forward into the mud, his body so light and wasted that he barely makes a sound when he hits the ground. In his final seconds, as the "Black Hole" finally closes, his "untouchable" aura flares up one last time in a violent spasm, the protagonist tries to catch him, but the recoil of his lifelong suffering hits the protagonist so hard they are thrown back

He dies face-down in the dirt, he is so exhausted that he doesn't even have the energy to close his eyes, he dies looking at the feet of the people he saved who are now full of energy and life because they "fed" their exhaustion into him until he broke

Option 3 Systematic Failure

After a lifetime of being "untouchable," his obsession with his own genetics leads to his undoing. While the protagonist and the rest of the world are away, perhaps celebrating a victory or off on a mission, he stays behind in his lab, convinced he is one step away from a breakthrough that would finally allow him to be "human"

The Cause of Death: Severe Biological Exhaustion

The Overwork: hasn't slept in weeks. His deadly shallow grey eyes are sunken, and his gaunt, 180cm frame has withered to bone. He is so focused on isolating the "Untouchable Gene" that he forgets to eat or hydrate

The Catalyst: He attempts a self-experiment, trying to "silence" the gene using a serum he developed. It doesn't work. Instead it causes a Cytokine Storm

The Systemic Collapse: His body begins to consume itself. Because his "loose muscles" are already wasted from stress, his organs begin to fail one by one

Even as he is dying, the scientist in him takes over, he crawls to his desk, clutching his brunette hair in clumps from the stress, and begins to record his final notes, he narrates his own heart failure, his dropping blood pressure, and the exact moment his kidneys shut down and as he grows colder, he realizes he can't even reach for a blanket or a heater because his coordination is gone, he is trapped on the cold floor of his lab, surrounded by glass beakers and blood samples, the only "family" he has left, in his final moments of delirium, he finds a match in his data, he realizes his lost twin sister is alive and likely nearby, he tries to reach for his communication device to tell the protagonist, but he is too exhausted, his fingers can't even press a button and he dies staring at the "Positive Match" on his screen, knowing he finally found her, but he's too tired to live another minute to see her

Because he is so quiet and observant, no one notices he is gone for days and by the time the protagonist enters the lab, he sees that he has been dead in the dark for a long time

"The lab is quiet tonight. My pulse is at 30 beats per minute. I've spent my whole life looking for the gene that made me a monster. Now that I've found it, I realize I don't have the energy to hate it anymore."

The Final Discovery: The "Safety" Switch

The Realization:

As he lies dying of exhaustion in his lab, his vision blurring, he knocks a chemical vial over. He goes to clean it up with his bare hand, something he hasn't done in years and he notices something in his notes he had ignored

The **Recessive Singularity** gene has a "**Psychosomatic Trigger**" The field of agony isn't actually constant, it is powered by his own fear and expectation of being a monster

The Logic: Because he grew up being told he was cursed, his brain maintained the "Agony Field" as a defense mechanism and if he had ever truly felt safe, or if someone had touched him with absolute, fearless love, the field would have neutralized

The Scientific Proof: He sees a slide under the microscope of his own cells reacting to a "calm" stimulus versus a "stress" stimulus, and when the cells are calm, the "Agony" spikes disappear

Or

He is alone in his lab, his body failing from severe systemic exhaustion, he is running a final, desperate simulation on his DNA sequence, looking for the "sister" match one last time, but as his brain begins to shut down, he stops looking for her and starts looking at the basal frequency of the gene itself

The Error: He finds a tiny, microscopic notation in the genetic "folding" The "Empathetic Agony" field wasn't a permanent broadcast but it was an impedance loop

Truth: The field only reacted to perceived threat, because he spent his life bracing for impact, his nervous system was in a permanent "High-Alert" state, which projected the pain

He sees a sensor on his lab table, a simple touch-pad he used for testing. In his dying weakness, he is too tired to be afraid anymore, he is too exhausted to "brace" himself and as his hand accidentally brushes the sensor, the monitor shows [NEUTRAL LOAD]

For the first time in ?? years, the field is down, not because he fixed it, but because he is too tired to maintain the fear

He realizes that right now, at this very second, he is "safe" and he could walk out of the lab, find the protagonist, and finally ask for a handshake or a hug as he tries to stand up. His loose muscles fail him, he tries to crawl toward the door, his brunette hair sweeping the dusty floor of the lab. He is **180cm of wasted potential**, unable to move even an inch

He is totally alone. There is no one to witness the fact that the curse is gone. He is finally "human" ... He lies on his back, staring at the ceiling of his lab. He looks at his gloved

hands, the gloves he never needed to wear. He realizes every cold night, every lonely birthday, and the "death" of his social life were all based on a scientific misunderstanding

He dies in the dark, seconds before the protagonist walks in, when the protagonist finally finds him and touches his cold cheek to mourn him, they feel nothing but cold skin. The protagonist thinks that the curse must have died with him, never knowing that he could have been touched his whole life if he had just known how to let go

Written in the margin of a gene map, the handwriting is barely legible

"It wasn't a wall. It was a mirror. I spent ?? years running away from a reflection. I can hear them laughing in the hall ... I could just go out there and join them. I could just reach out. But I'm so tired. I've spent all my energy building a cage, and now I don't have enough left to open the door."
